OnFILTER, a U.S. manufacturer of high-performance EMI filters and instrumentation, presents its filtered power distribution unit (PDU) **AREC148FG**.

OnFILTER's patented filtered power distribution unit offers highly effective suppression of electromagnetic interference (EMI) on power lines and ground. In addition, AREC148FG offers two-stage transient surge protection going beyond traditional MOV approach. This additional protection reduces power line transients down to typically below 10V while traditional MOV technology would allow passage of transients up to 900V, overstressing sensitive equipment.

AREC148FG offers eight outputs, built-in circuit breaker, and a display with voltage, current, power, and energy readings. The PDU is packaged in a standard 19" rack.

OnFILTER shows its filters at Productronica 2023 in Hall B2, Booth 518. This is the first time OnFILTER brings its products, that are already popular in North America and in Asia, to Europe

OnFILTER is located in Santa Cruz, California, USA, where all OnFILTER's products are manufactured.
